#### Equations

## $u(x_1,...,x_k)=1$

æ

Usually the left side u of any equation u = 1 over any group G is

element of a free product

$$G_X = G * F(X),$$

where

$$X = \{x_1, ..., x_k\}$$

is considered as the set of variables Vitaly Roman'kov

#### Free products in variety

We think that more naturally is to take free product in the variety  $\mathcal{L} = Var(G)$  generated by G.

So we assume that  $F(X) = F_{\mathcal{L}}(X)$  is a free group in the variety  $\mathcal{L}$ , and

I ≡ →

$$G_X = G *_{\mathcal{L}} F(X)$$

is a free product in this variety.

#### Free products in variety

So we assume that  $F(X) = F_{\mathcal{L}}(X)$  is a free group in the variety  $\mathcal{L}$ , and

伺 ト く ヨ ト く ヨ ト

$$G_X = G *_{\mathcal{L}} F(X)$$

is a free product in this variety.

# An equation w = 1 in k variables is defined by any element $w \in G_X$ .

Vitaly Roman'kov

An equation w = 1 is SAT if it is satisfiable (has a solution) in G.

An equation w = 1 is **NSAT** if it is non-satisfiable (has no solutions) in *G*.

伺 ト く ヨ ト く ヨ ト

Stratification

Let T be a countable set equipped with a *size* (or length) function  $s: T \to \mathbb{N}$  such that for every  $n \in \mathbb{N}$  the *ball* 

$$B_n = \{t \in T \mid s(t) \le n\}$$

#### is finite.

The size function s induces a volume stratification of the set T:

· < E > < E >

$$T=\cup_{r=0}^{\infty}B_r,$$

which gives a "direction" to infinity in T.

Stratification

$$T=\cup_{r=0}^{\infty}B_r,$$

which gives a "direction" to infinity in T.

#### Relative frequency

For a subset  $A \subseteq T$  and a finite subset  $B \subset T$  we define a relative frequency

$$d(A|B)=\frac{|A\cap B|}{|B|},$$

Now, one can define the *r*-frequency (or *r*-density) of A with respect to the stratification T (or the size function s) by

$$d_r(A) = d(A|B_r).$$

#### Asymptotic density

Now, the asymptotic density of A with respect to the stratification T is defined as the following limit

$$ad(A) = \limsup_{r \to \infty} d_r(A)$$

If the actual limit

$$sad(A) = \lim_{r \to \infty} d_r(A)$$

exists then we call it the strict asymptotic density of A. A is called generic if sad(A) = 1 and it is negligible if sad(A) = 0.

#### Asymptotic density

Now, the asymptotic density of A with respect to the stratification T is defined as the following limit

$$ad(A) = \limsup_{r \to \infty} d_r(A)$$

#### If the actual limit

$$sad(A) = \lim_{r \to \infty} d_r(A)$$

exists then we call it the strict asymptotic density of A. A is called generic if sad(A) = 1 and it is negligible if sad(A) = 0.

# Uniform asymptotic density of power sets in free abelian groups

The asymptotic density of any power set  $\gamma \mathbb{Z}^k \subseteq \mathbb{Z}^k$  is almost obvious. But we need in estimates on the convergence rates that we could not find in the literature.

#### **Proposition 1.**

Let 
$$\gamma, k \in \mathbb{N}^+$$
. Then  
1)  $sad(\gamma \mathbb{Z}^k) = 1/\gamma^k$ ;  
2)  $|d_r(\gamma \mathbb{Z}^k) - 1/\gamma^k| \le \frac{2^{k+1}k}{r\gamma^{k-1}}$  for every  $r \ge \gamma$ ,  
3)  $d_r(\gamma \mathbb{Z}^k)$  converges to  $1/\gamma^k$  uniformly in  $\gamma$ 

Primitive and  $\gamma$ -primitive elements of free abelian groups

An element  $x = x_1^{\gamma_1} ... x_k^{\gamma_k} \in A(X)$ , where A(X) is the free abelian group with basis X is called

primitive (visuable)

if and only if it is a member of some basis of A(X), or, equivalently,  $gcd(\gamma_1, ..., \gamma_k) = 1$ . It is called

 $\gamma$ -primitive ( $\gamma$ -visuable)

if and only if it is  $\gamma$ -power of some primitive element, or, equivalently,  $gcd(\gamma_1, ..., \gamma_k) = \gamma$ .

イロン 不同 とくほう イロン

# Asymptotic density of sets of $\gamma-{\rm primitive}$ elements in free abelian groups

Let  $P_{k,\gamma}$  be the set of all  $\gamma$ -primitive elements in the free abelian group A(X) of rank k.

The following result is well-known in number theory. In the case k = 2 it was proved by F. Mertens (1874), in full generality it is due to Christopher (1956). Below  $\zeta(k) = \sum_{n=1}^{\infty} \frac{1}{n^k}$  denotes Riemann zeta-function.

#### **Proposition 2.**

For each  $\gamma \in \mathbf{N}$  we have

$$\mathsf{sad}(\mathsf{P}_{k,\gamma}) = rac{1}{\gamma^k \zeta(k)}.$$

# Uniform asymptotic density of $\gamma$ -primitive sets in free abelian groups

Also we need in estimates on the convergence rates for the sets  $P_{k,\gamma}$ .

#### **Proposition 3.**

Let  $\gamma, k \in \mathbb{N}^+, \gamma \geq 2$ . Then 1) For every  $\varepsilon \geq 0$  there exists  $r(\varepsilon) \in \mathbb{N}^+$  such that  $|d_r(P_{k,\gamma}) - \frac{1}{\gamma^k \zeta(k)}| \leq \frac{\varepsilon}{\gamma^{k-1}}$ for every  $r \geq r(\varepsilon)$ . 2)  $d_r(P_{k,\gamma})$  converges to  $\frac{1}{\gamma^k \zeta(k)}$  uniformly in  $\gamma$ .

### **FREE ABELIAN GROUPS**

▲□ ▶ ▲ □ ▶ ▲ □ ▶

э

#### Equations

Let  $A = \mathbb{Z}^m$ be a free abelian group with basis  $\{a_1, ..., a_m\}$   $(m \ge 1)$ . Now  $F(X) = \mathbb{Z}^k$ is the free abelian group with basis  $\{x_1, ..., x_k\}$   $(k \ge 1)$ , and  $A_X = A \times F(X) = \mathbb{Z}^{m+k}$ is the free abelian group with basis  $\{a_1, ..., a_m, x_1, ..., x_k\}$ .

#### Satisfiable equations

Every element  $w \in A_X$  can be uniquely written in the form

$$w = x_1^{\gamma_1} \dots x_k^{\gamma_k} a_1^{\alpha_1} \dots a_m^{\alpha_m},$$

where  $\gamma_1, ..., \gamma_k, \alpha_1, ..., \alpha_m \in \mathbf{Z}$ . We call  $\gamma = gcd(\gamma_1, ..., \gamma_k)$  the exponent of w and denote it as  $\gamma = exp(w)$ . In the exceptional case  $\gamma_1 = ... = \gamma_k = 0$  we define exp(u) = 0.

- 4 同 6 4 日 6 4 日 6

#### Satisfiable equations

#### Lemma 1.

An equation w = 1 of non-zero exponent  $\gamma = exp(u)$  has a solution in A if and only if  $\gamma | gcd(\alpha_1, ..., \alpha_m)$ . For k = 1 and  $\gamma_1 = \pm \gamma \neq 0$  there is the unique solution  $x_1 = a_1^{-\alpha_1/\gamma_1}...a_m^{-\alpha_m/\gamma_1}$ . When exp(u) = 0 a solution exists if and only if  $\alpha_1 = ... = \alpha_m = 0$  (every tuple of k elements is a solution).

(日)

#### Stratification

For a free abelian group  $Z^q$  a length function  $I : Z^q \to N$  will usually be the restriction to  $Z^q$  of  $|| \cdot ||_{\infty}$ -norm from  $\mathbf{R}^q$ .

The norm  $|| \cdot ||$  of an element w is defined as

 $||w|| = max\{|\gamma_1|, ..., |\gamma_k|, |\alpha_1|, ..., |\alpha_m|\}.$ 

The function  $I : A_X \to \mathbf{N}$  is defined as I(u) = ||u||. There are the boxes  $B_r = \{w \in A_X : I(w) \le r\}$ , and their slices  $B_r(\gamma) = \{w \in A_X : I(w) \le r, exp(w) = \gamma\}$ , for  $\gamma = 0, 1, 2, ...$ 

イロン 不同 とくほう イロン

#### One-variable equations

#### Theorem 1.

For  $r, m \in \mathbb{N}^+$ 

$$| d_r(SAT(A,1)) - \frac{\mathcal{Z}_r(m)}{r} | = O\left(\frac{\mathcal{Z}_r(m-1)}{r^2}\right),$$

where

$$\mathcal{Z}_r(k) = \sum_{n=1}^r = 1/n^k$$

イロン イロン イヨン イヨン

э

#### One-variable equations

#### Corollary 1.

The set SAT(A, 1) is negligible, and NSAT(A, 1) is generic.

イロン 不聞 とくほとう ほどう

3

#### Multi-variable equations

#### Theorem 2.

Assume that  $k \ge 2, m \ge 1$ . Then the set SAT(A, k) has the asymptotic density

$$sad(SAT(A,k)) = \frac{\zeta(k+m)}{\zeta(k)}$$

### **FREE NILPOTENT GROUPS**

▲御▶ ▲理▶ ▲理▶

э

#### Free nilpotent groups

Let

 $N = N_{mc}$ 

be a free nilpotent group of rank m and class c with basis  $\{a_1, ..., a_m\}$ .

Now

$$F(X) = F_{\mathcal{N}_c}(X) = N_{kc}$$

・ 同 ト ・ ヨ ト ・ ヨ ト

is the free nilpotent group of rank k and class c with basis  $\{x_1, ..., x_k\}$ .

Then every element  $u \in N_X$  can be uniquely written in the form:

$$u = x_1^{\gamma_1} ... x_k^{\gamma_k} a_1^{\alpha_1} ... a_m^{\alpha_m} \prod_{j=1}^p b_j^{\delta_j}.$$

where  $b_1 < ... < b_p$  denote the set of all basic commutators of weights  $\ge 2$  on  $a_1, ..., a_m, x_1, ..., x_k$ . We assume that the ordering of all basic commutators of weight  $j \ge 2$  is such that first  $s_{j-1}$ ones depend in  $a_i$  only, and other  $p_{j-1} - s_{j-1}$  of them occur at least one of  $x_j$ .

コマン きょう きょう

#### Norm

#### The norm $|| \cdot ||$ of an element $u \in N_X$ is defined as

$$||u|| = max\{|\gamma_i|, |\alpha_l|, |\delta_j| \ (i = 1, ..., k; l = 1, ..., m; j = 1, ..., p)\}.$$

The function  $I : N_X \to \mathbb{N}$  is defined as I(u) = ||u||. There are the boxes:  $B_r = \{u \in N_X : I(u) \le r\}$ , and the slices:  $B_{r,\gamma} = \{u \in N_X : I(u) \le r, \gamma = exp(u) = gcd(\gamma_1, ..., \gamma_k) \text{ (or 0 if } \gamma_1 = ... = \gamma_k = 0)\}.$ 

< ロ > < 同 > < 三 > < 三 > 、

#### Norm

#### The norm $|| \cdot ||$ of an element $u \in N_X$ is defined as

$$||u|| = max\{|\gamma_i|, |\alpha_l|, |\delta_j| \ (i = 1, ..., k; l = 1, ..., m; j = 1, ..., p)\}.$$

The function  $I: N_X \to \mathbb{N}$  is defined as I(u) = ||u||. There are the boxes:  $B_r = \{u \in N_X : I(u) \le r\}$ , and the slices:  $B_{r,\gamma} = \{u \in N_X : I(u) \le r, \gamma = exp(u) = gcd(\gamma_1, ..., \gamma_k) \text{ (or 0 if } \gamma_1 = ... = \gamma_k = 0)\}.$ 

Main theorem

Now we can formulate our main assertions for nilpotent case.

#### Theorem 3.

Assume that  $k, m \ge 2, c \ge 2$ . Then the set SAT(N, k) has the asymptotic density

$$ad(SAT(N,k)) \ge \frac{\zeta(k+m+s)}{\zeta(k)},$$
 (1)

where s denote the total number of all basic commutators at  $a_1, ..., a_m$  of weights 2, ..., c - 1.

### **FREE GROUPS**

・ロン ・部 と ・ ヨ と ・ ヨ と …

э

#### Preliminaries

Let

 $F = F_m$ 

be a free group of rank  $m \geq 2$  with basis  $\mathcal{F} = \mathcal{F}_m = \{f_1, ..., f_m\}$ , and

 $F(X) = F_k$ 

is the free group of rank  $k \ge 1$  with basis  $X = \{x_1, ..., x_k\}$ . Then

$$F_X = F * F(X) = F_{m+k}$$

is a space of all equations with variables from X and constants from F.

As before,  $F_X$  has the ball and spherical stratifications:

$$\cup_{r=0}^{\infty}B_r=F_X, \cup_{r=0}^{\infty}S_r=F_X,$$

・ロン ・部 と ・ ヨ と ・ ヨ と …

э

relative to basis  $\mathcal{F} \cup X$ .

# Connection between solvability of equations in free and free abelian groups

As usual,  $A_X = A \times A(X)$  is the free abelian group of rank m + k, the standard epimorphic image for  $\mu : F_X \to F_X/F'_X = A_X$ . A basis of  $A_X$  is taken as  $\{a_1, ..., a_m\}$ , and  $\mu(f_i) = a_i, \mu(x_j) = x_j$ . For  $a \in A$  put

$$S_r(a) = \{f \in S_r : \mu(f) = a\} = \mu^{-1}(a) \cap S_r.$$

- 4 同 6 4 日 6 4 日 6

# Connection between solvability of equations in free and free abelian groups

We need to recall two known results that relate asymptotics in  $F_q$  and  $A_q$ . **Theorem by Sharp (2001).** Let  $a \in A_q$  and  $r \in \mathbb{N}$ . Then

$$\begin{split} \lim_{r \to \infty} |\sigma^q r^{q/2} (\frac{|S_r(a)|}{|S_r|} + \frac{|S_{r+1}(a)|}{|S_{r+1}|}) - \frac{2}{(2\pi)^{q/2}} e^{-||a||_2^2/2\sigma^2 r}| = 0, \\ \text{uniformly in } a \in A. \end{split}$$

Here 
$$\sigma^2 = \frac{1}{\sqrt{2q-1}} (1 + (\frac{q+\sqrt{2q-1}}{q-\sqrt{2q-1}})^{1/2}).$$

#### Corollary

**Corollary 1.** There is a constant  $c \in \mathbb{N}$  such that for any  $a \in A_q$ and  $r \in \mathbb{N} \frac{|S_{2r+\delta_a}(a)|}{|S_{2r+\delta_a}|} \leq \frac{c}{r^{q/2}}$ ,

(日)

3

where  $\delta_a = 0$  if  $||a||_1$  is even, and  $\delta_a = 1$  if  $||a||_1$  is odd.

#### Rivin's theorem

#### **Theorem by Rivin (1999).** For any $D \subseteq \mathbb{R}^q$ , $q \ge 2$ ,

$$\lim_{r\to\infty} \frac{1}{|S_r|} |\{w \in S_r | \mu(w)/r^{1/2} \in D\}| = \frac{1}{(2\pi)^{q/2}\sigma^q} \int_D e^{-||t||_2^2/2\sigma^2} dt.$$

э

《曰》《聞》《臣》《臣》

#### Asymptotic of one-variable equations

#### Theorem 4.

The set SAT(F, 1) is negligible relative to both ball and spherical stratifications, so sad(SAT(F, 1)) = 0, sad(NSAT(F, 1)) = 1.

(日)

#### Split equations

We say that an equation u = 1,  $u \in F_X$ , splits if  $u = vg^{-1}$ , and so it is equivalent to equation

$$v = v(x_1, ..., x_k) = g,$$

where  $v = v(x_1, ..., x_k) \in F(X)$  and  $g \in F$ . Denote by V(F, k) the set of all split equations in k variables over F. Also let

#### $SAT_V(F,k)$

and

#### $NSAT_V(F, k)$

be the sets of all satisfiable and all unsatisfiable split equations from V(F, k).

#### Conditions of satisfiability

The image of an element  $u \in F_X$  under  $\mu : F_X \to A_X$  can be uniquely written as

$$u^{\mu}=x_1^{\gamma_1}...x_k^{\gamma_k}a_1^{\alpha_1}...a_m^{\alpha_m}.$$

(日) (同) (三) (三)

We define  $exp(u) = exp(u^{\mu}) = gcd(\gamma_1, ..., \gamma_k)$ .

Lemma 2.

Let  $u \in V(F, k)$ . If exp(u) = 1 then  $u \in SAT_V(F, k)$ .

#### Conditions of satisfiability

The image of an element  $u \in F_X$  under  $\mu : F_X \to A_X$  can be uniquely written as

$$u^{\mu} = x_1^{\gamma_1} ... x_k^{\gamma_k} a_1^{\alpha_1} ... a_m^{\alpha_m}$$

We define  $exp(u) = exp(u^{\mu}) = gcd(\gamma_1, ..., \gamma_k)$ .

#### Lemma 2.

Let  $u \in V(F, k)$ . If exp(u) = 1 then  $u \in SAT_V(F, k)$ .

#### Lemma

#### Lemma 3.

Let  $k \ge m$ . Then for every  $\varepsilon > 0$  there exists  $0 < \alpha < 1$  and a number  $r_0 = r(\varepsilon, \alpha) \in \mathbb{N}$  such that for every  $r \ge r_0$  the following inequality holds

$$\frac{|V_{\alpha}(F,k)\cap S_r|}{|V(F,k)\cap S_r|}\leq \varepsilon.$$

イロト イポト イヨト イヨト

Here  $V_{\alpha}(F, k) = \{ vg \in V(F, k) | |g| \le \alpha |vg| \}.$ 

Assume that  $k \ge 2$  and  $k \ge m$ . Then the asymptotic density of the set  $SAT_V(F, k)$  can be estimated as follows:

(日) (同) (三) (三)

#### Theorem 5.

 $ad(SAT_V(F,k)) \geq \frac{2}{(2k-1)\zeta(k)}.$ 

The set NSAT(F, k) can be estimated too.

Assume that  $k \ge 2$  and  $k \ge m$ . Then the asymptotic density of the set  $SAT_V(F, k)$  can be estimated as follows:

イロト イポト イヨト イヨト

#### Theorem 5.

$$ad(SAT_V(F,k)) \geq \frac{2}{(2k-1)\zeta(k)}.$$

The set NSAT(F, k) can be estimated too.
