# Theorem (smn theorem)

For all  $m, n \in \mathbb{N}$ , a partial function  $f : \mathbb{N}^{m+n} \to \mathbb{N}$  is partial-recursive if and only if there is a recursive function  $s : \mathbb{N}^m \to \mathbb{N}$  such that, for all  $e_1, \ldots, e_m, x_1, \ldots, x_n \in \mathbb{N}$  we have that  $f(e_1, \ldots, e_m, x_1, \ldots, x_n) = \varphi_{s(e_1, \ldots, e_m)}(\langle x_1, \ldots, x_n \rangle)$ . That is to say, a partial function  $f : \mathbb{N}^k \to \mathbb{N}$  is partial recursive if and only if, whenever we hold some of its variables fixed, the remaining function is partial recursive.

<□ > < @ > < E > < E > E のQ @

Let  $f : \mathbb{N} \to \mathbb{N}$  be a recursive function. Then there exists  $n \in \mathbb{N}$  with  $\varphi_n = \varphi_{f(n)}$  (as functions).

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへぐ

Let  $f : \mathbb{N} \to \mathbb{N}$  be a recursive function. Then there exists  $n \in \mathbb{N}$  with  $\varphi_n = \varphi_{f(n)}$  (as functions).

So every recursive function f has a 'fixed point' on indices of partial recursive functions.

Let  $f : \mathbb{N} \to \mathbb{N}$  be a recursive function. Then there exists  $n \in \mathbb{N}$  with  $\varphi_n = \varphi_{f(n)}$  (as functions).

So every recursive function f has a 'fixed point' on indices of partial recursive functions.

We now have all the tools necessary to prove our recursion theory results:

Fix any k > 0. Then there is no partial recursive function  $g : \mathbb{N}^{k+2} \to \mathbb{N}$  such that, given  $n, x_0, \ldots, x_k \in \mathbb{N}$  satisfying  $|\{x_0, \ldots, x_k\} \cap W_n| \le 1$ , we have that  $g(n, x_0, \ldots, x_k)$  halts with output  $x_i \in \{x_0, \ldots, x_k\}$  such that  $x_i \notin W_n$ .

Fix any k > 0. Then there is no partial recursive function  $g : \mathbb{N}^{k+2} \to \mathbb{N}$  such that, given  $n, x_0, \ldots, x_k \in \mathbb{N}$  satisfying  $|\{x_0, \ldots, x_k\} \cap W_n| \le 1$ , we have that  $g(n, x_0, \ldots, x_k)$  halts with output  $x_i \in \{x_0, \ldots, x_k\}$  such that  $x_i \notin W_n$ .

That is, given a recursively enumerable set  $W_n$  and k elements, at most one of which lies in  $W_n$ , we can't recursively pick one lying OUTSIDE  $W_n$ .

(We say nothing about the behaviour of g when the input is not 'valid'.)

Assume such a g exists. Define  $f : \mathbb{N} \times \mathbb{N} \to \mathbb{N}$  by

$$f(n,m) := \begin{cases} 0 \text{ if } g(n,0,\ldots,k) = j \in \{0,\ldots,k\} \text{ and } m = j \\ \uparrow \text{ in all other cases} \end{cases}$$

<□ > < @ > < E > < E > E のQ @

Assume such a g exists. Define  $f : \mathbb{N} \times \mathbb{N} \to \mathbb{N}$  by

$$f(n,m) := \begin{cases} 0 \text{ if } g(n,0,\ldots,k) = j \in \{0,\ldots,k\} \text{ and } m = j \\ \uparrow \text{ in all other cases} \end{cases}$$

Then f is partial-recursive, since g is. By the smn theorem, there exists a recursive function  $s : \mathbb{N} \to \mathbb{N}$  such that  $f(n, m) = \varphi_{s(n)}(m)$ for all m, n. Since s is recursive, the Kleene recursion theorem shows that there must be some n' such that  $\varphi_{s(n')} = \varphi_{n'}$ . Thus  $f(n',m) = \varphi_{n'}(m)$  for all  $m \in \mathbb{N}$ . Moreover, by definition,  $\varphi_{n'}(m)$ can halt on at most one of the cases m = 0, ..., m = k (if at all), and no other values. Thus  $|\{0,\ldots,k\} \cap W_{n'}| \leq 1$ . So  $g(n', 0, \ldots, k)$  will halt and output  $j \in \{0, \ldots, k\} \setminus W_{n'}$  (by construction of g). But since g(n', 0, ..., k) halts with output j in  $\{0, \ldots, k\}$ , then f(n', j) halts (by construction of f). Hence  $\varphi_{n'}(j)$ halts (by definition of  $\varphi_{n'}$ ), and so  $j \in W_{n'}$  since  $W_{n'}$  is precisely the halting set of  $\varphi_{n'}$ . Thus we have a contradiction, as we showed  $i \notin W_{n'}$ , so no such g can exist.

Assume such a g exists. Define  $f : \mathbb{N} \times \mathbb{N} \to \mathbb{N}$  by

$$f(n,m) := \begin{cases} 0 \text{ if } g(n,0,\ldots,k) = j \in \{0,\ldots,k\} \text{ and } m = j \\ \uparrow \text{ in all other cases} \end{cases}$$

Then f is partial-recursive, since g is. By the smn theorem, there exists a recursive function  $s : \mathbb{N} \to \mathbb{N}$  such that  $f(n, m) = \varphi_{s(n)}(m)$ for all m, n. Since s is recursive, the Kleene recursion theorem shows that there must be some n' such that  $\varphi_{s(n')} = \varphi_{n'}$ . Thus  $f(n',m) = \varphi_{n'}(m)$  for all  $m \in \mathbb{N}$ . Moreover, by definition,  $\varphi_{n'}(m)$ can halt on at most one of the cases m = 0, ..., m = k (if at all), and no other values. Thus  $|\{0,\ldots,k\} \cap W_{n'}| \leq 1$ . So  $g(n', 0, \ldots, k)$  will halt and output  $j \in \{0, \ldots, k\} \setminus W_{n'}$  (by construction of g). But since g(n', 0, ..., k) halts with output j in  $\{0, \ldots, k\}$ , then f(n', j) halts (by construction of f). Hence  $\varphi_{n'}(j)$ halts (by definition of  $\varphi_{n'}$ ), and so  $j \in W_{n'}$  since  $W_{n'}$  is precisely the halting set of  $\varphi_{n'}$ . Thus we have a contradiction, as we showed  $i \notin W_{n'}$ , so no such g can exist.
Assume such a g exists. Define  $f : \mathbb{N} \times \mathbb{N} \to \mathbb{N}$  by

$$f(n,m) := \begin{cases} 0 \text{ if } g(n,0,\ldots,k) = j \in \{0,\ldots,k\} \text{ and } m = j \\ \uparrow \text{ in all other cases} \end{cases}$$

Assume such a g exists. Define  $f : \mathbb{N} \times \mathbb{N} \to \mathbb{N}$  by

$$f(n,m) := \begin{cases} 0 \text{ if } g(n,0,\ldots,k) = j \in \{0,\ldots,k\} \text{ and } m = j \\ \uparrow \text{ in all other cases} \end{cases}$$

Assume such a g exists. Define  $f : \mathbb{N} \times \mathbb{N} \to \mathbb{N}$  by

$$f(n,m) := \begin{cases} 0 \text{ if } g(n,0,\ldots,k) = j \in \{0,\ldots,k\} \text{ and } m = j \\ \uparrow \text{ in all other cases} \end{cases}$$

Assume such a g exists. Define  $f : \mathbb{N} \times \mathbb{N} \to \mathbb{N}$  by

$$f(n,m) := \begin{cases} 0 \text{ if } g(n,0,\ldots,k) = j \in \{0,\ldots,k\} \text{ and } m = j \\ \uparrow \text{ in all other cases} \end{cases}$$

Assume such a g exists. Define  $f : \mathbb{N} \times \mathbb{N} \to \mathbb{N}$  by

$$f(n,m) := \begin{cases} 0 \text{ if } g(n,0,\ldots,k) = j \in \{0,\ldots,k\} \text{ and } m = j \\ \uparrow \text{ in all other cases} \end{cases}$$

Assume such a g exists. Define  $f : \mathbb{N} \times \mathbb{N} \to \mathbb{N}$  by

$$f(n,m) := \begin{cases} 0 \text{ if } g(n,0,\ldots,k) = j \in \{0,\ldots,k\} \text{ and } m = j \\ \uparrow \text{ in all other cases} \end{cases}$$

In a very similar manner, we can prove the following:

# Theorem (Boone-Adian-Rabin)

We have an explicit algorithm that, on input of  $m, n \in \mathbb{N}$ , constructs a finite presentation  $\Pi_{m,n}$  such that: 1.  $\overline{\Pi}_{m,n} \cong \{e\}$  if and only if  $n \in W_m$ .

From hereon, if P is a presentation of a group, the we denote by  $\overline{P}$  the group presented by P.

# Theorem (Boone-Adian-Rabin)

We have an explicit algorithm that, on input of  $m, n \in \mathbb{N}$ , constructs a finite presentation  $\Pi_{m,n}$  such that:

1.  $\overline{\Pi}_{m,n} \cong \{e\}$  if and only if  $n \in W_m$ .

2. If  $\overline{\Pi}_{m,n}$  is non-trivial then it is perfect, 2-generated, torsion free, and freely indecomposable (ie: can't be expressed as a non-trivial free product).

Using this, and our  $\Pi_{m,n}$  presentations, we can now show:

Lemma (Encoding recursion theory into groups)

Let P be a finite presentation of a group that splits as a free product  $A_1 * \cdots * A_n$ , with all the  $A_i$  indecomposable. Let  $B_1 * \cdots * B_k$  be another such splitting into indecomposable groups. Then n = k, and there exists a permutation  $\sigma \in S_n$  such that  $A_i \cong B_{\sigma(i)}$  for all  $1 \le i \le n$ .

Using this, and our  $\Pi_{m,n}$  presentations, we can now show:

Lemma (Encoding recursion theory into groups) There is no algorithm that, on input of a finite presentation of the form  $Q = \prod_{n,a} * \prod_{n,b} * \prod_{n,c}$ , where  $|\{a, b, c\} \cap W_n| \le 1$ , outputs two finite presentations A, B of non-trivial groups such that  $\overline{Q} \cong \overline{A} * \overline{B}$ .

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○○ ○○○

We proceed by contradiction. As  $|\{a, b, c\} \cap W_n| \leq 1$ , we must have at least two of  $\overline{\Pi}_{n,a}, \overline{\Pi}_{n,b}, \overline{\Pi}_{n,c}$  are non-trivial. So split  $\overline{Q}$  as  $\overline{A} * \overline{B}$ , with  $\overline{A}, \overline{B}$  both non-trivial. We consider 2 cases:

We proceed by contradiction. As  $|\{a, b, c\} \cap W_n| \leq 1$ , we must have at least two of  $\overline{\Pi}_{n,a}, \overline{\Pi}_{n,b}, \overline{\Pi}_{n,c}$  are non-trivial. So split  $\overline{Q}$  as  $\overline{A} * \overline{B}$ , with  $\overline{A}, \overline{B}$  both non-trivial. We consider 2 cases: Case 1. Precisely one of a, b, c lies in  $W_n$ . If  $a \in W_n$ , then  $\overline{Q} \cong \overline{\Pi}_{n,b} * \overline{\Pi}_{n,c}$ . This is an indecomposable splitting, so  $\overline{A}$  must be isomorphic to at least one of  $\overline{\Pi}_{n,b}, \overline{\Pi}_{n,c}$ . The same idea works if instead  $b \in W_n$  or  $c \in W_n$ . So, regardless of which of a, b, c lie in  $W_n, \overline{A}$  is isomorphic to at least one of  $\overline{\Pi}_{n,a}, \overline{\Pi}_{n,b}, \overline{\Pi}_{n,c}$ .

We proceed by contradiction. As  $|\{a, b, c\} \cap W_n| \leq 1$ , we must have at least two of  $\overline{\Pi}_{n,a}, \overline{\Pi}_{n,b}, \overline{\Pi}_{n,c}$  are non-trivial. So split  $\overline{Q}$  as  $\overline{A} * \overline{B}$ , with  $\overline{A}, \overline{B}$  both non-trivial. We consider 2 cases: Case 1. Precisely one of a, b, c lies in  $W_n$ . If  $a \in W_n$ , then  $\overline{Q} \cong \overline{\Pi}_{n,b} * \overline{\Pi}_{n,c}$ . This is an indecomposable splitting, so  $\overline{A}$  must be isomorphic to at least one of  $\overline{\Pi}_{n,b}, \overline{\Pi}_{n,c}$ . The same idea works if instead  $b \in W_n$  or  $c \in W_n$ . So, regardless of which of a, b, c lie in  $W_n$ ,  $\overline{A}$  is isomorphic to at least one of  $\overline{\Pi}_{n,a}$ ,  $\overline{\Pi}_{n,b}$ ,  $\overline{\Pi}_{n,c}$ . Case 2. None of a, b, c lie in  $W_n$ . Then  $\overline{Q} \cong \overline{\Pi}_{n,a} * \overline{\Pi}_{n,b} * \overline{\Pi}_{n,c}$  is a splitting into indecomposable groups. Thus precisely one of  $\overline{A}, \overline{B}$ splits as a free product; the other does not. Hence, at least one of  $\overline{A}, \overline{B}$  must be isomorphic to at least one of  $\overline{\Pi}_{n,a}, \overline{\Pi}_{n,b}, \overline{\Pi}_{n,c}$ .

We proceed by contradiction. As  $|\{a, b, c\} \cap W_n| \leq 1$ , we must have at least two of  $\overline{\Pi}_{n,a}, \overline{\Pi}_{n,b}, \overline{\Pi}_{n,c}$  are non-trivial. So split  $\overline{Q}$  as  $\overline{A} * \overline{B}$ , with  $\overline{A}, \overline{B}$  both non-trivial. We consider 2 cases: Case 1. Precisely one of a, b, c lies in  $W_n$ . If  $a \in W_n$ , then  $\overline{Q} \cong \overline{\Pi}_{n,b} * \overline{\Pi}_{n,c}$ . This is an indecomposable splitting, so  $\overline{A}$  must be isomorphic to at least one of  $\overline{\Pi}_{n,b}, \overline{\Pi}_{n,c}$ . The same idea works if instead  $b \in W_n$  or  $c \in W_n$ . So, regardless of which of a, b, c lie in  $W_n$ ,  $\overline{A}$  is isomorphic to at least one of  $\overline{\prod}_{n,a}, \overline{\prod}_{n,b}, \overline{\prod}_{n,c}$ . Case 2. None of a, b, c lie in  $W_n$ . Then  $\overline{Q} \cong \overline{\Pi}_{n,a} * \overline{\Pi}_{n,b} * \overline{\Pi}_{n,c}$  is a splitting into indecomposable groups. Thus precisely one of  $\overline{A}, \overline{B}$ splits as a free product; the other does not. Hence, at least one of  $\overline{A}, \overline{B}$  must be isomorphic to at least one of  $\overline{\Pi}_{n,a}, \Pi_{n,b}, \Pi_{n,c}$ . In either case, at least one of  $\overline{\Pi}_{n,a}, \overline{\Pi}_{n,b}, \overline{\Pi}_{n,c}$  is isomorphic to at least one of  $\overline{A}, \overline{B}$ ; these latter two being non-trivial groups. We can recursively begin searching for such an isomorphism. This process will eventually halt, and thus give one of  $\Pi_{n,a}, \Pi_{n,b}, \Pi_{n,c}$  as non-trivial, and hence one of a, b, c not in  $W_n$ . This contradicts our first recursion theory result.

# Theorem (C. 2010)

Fix any k > 0. Then there is no algorithm that, on input of a finite presentation  $P = \langle X | R \rangle$  of a non-trivial group  $\overline{P}$ , outputs a word w on X of length at most k such that w is non-trivial in  $\overline{P}$ .

So if there was an algorithm to output a non-trivial element from a non-trivial group, then there would be no bound on the length of the words which it could output. Hence, knowing a group is non-trivial is NOT enough to be able to algorithmically output a non-trivial generator (which is the first place one would naively look for a non-trivial element).
<ロ> <@> < E> < E> E のQの

### Lemma

There is no algorithm that, on input of a finite presentation  $P = \langle X | R \rangle$  of a group with torsion, and some finite n which is the order of some element of  $\overline{P}$ , outputs a word w on X which represents any torsion element of  $\overline{P}$  (not necessarily of order n).

### Lemma

There is no algorithm that, on input of a finite presentation  $P = \langle X | R \rangle$  of a group with torsion, and some finite n which is the order of some element of  $\overline{P}$ , outputs a word w on X which represents any torsion element of  $\overline{P}$  (not necessarily of order n).

So knowing a group has torsion, AND the order of some torsion element, is still not enough to algorithmically construct a torsion element. We can easily use this to show the following result:

### Lemma

There is no algorithm that, on input of a finite presentation  $P = \langle X | R \rangle$  of a group with torsion, and some finite n which is the order of some element of  $\overline{P}$ , outputs a word w on X which represents any torsion element of  $\overline{P}$  (not necessarily of order n).

So knowing a group has torsion, AND the order of some torsion element, is still not enough to algorithmically construct a torsion element. We can easily use this to show the following result:

### Theorem (C. 2010)

There is no algorithm that, on input of two finite presentations  $P = \langle X | R \rangle$  and  $Q = \langle Y | S \rangle$  such that  $\overline{P}$  embeds in  $\overline{Q}$ , outputs an explicit map  $\theta : X \to W(Y)$  such that  $\theta$  extends to an embedding  $\overline{\theta} : \overline{P} \hookrightarrow \overline{Q}$ .

(ロ) (個) (E) (E) (E) (の)(C)

Just take Q to be a presentation of a group with torsion of order n. Then  $\overline{\langle t|t^n\rangle}$  embeds in  $\overline{Q}$ . But being able to construct such an embedding would enable us to identify a torsion element (the image of t), which contradicts the previous lemma.

Theorem (Markov)

## Theorem (Markov)

There is a recursive procedure that, on input of a finite presentation  $P = \langle X | R \rangle$  of a group, constructs a finite triangulation M(P) of a closed 4-manifold with the following properties:

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

## Theorem (Markov)

There is a recursive procedure that, on input of a finite presentation  $P = \langle X | R \rangle$  of a group, constructs a finite triangulation M(P) of a closed 4-manifold with the following properties:

< □ > < 同 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

1. 
$$\pi_1(M(P)) \cong \overline{P}$$
.

## Theorem (Markov)

There is a recursive procedure that, on input of a finite presentation  $P = \langle X | R \rangle$  of a group, constructs a finite triangulation M(P) of a closed 4-manifold with the following properties:

1.  $\pi_1(M(P)) \cong \overline{P}$ .

2. If P and Q are finite presentations, then M(P \* Q) is homeomorphic to the connect sum M(P)#M(Q).

## Theorem (Markov)

There is a recursive procedure that, on input of a finite presentation  $P = \langle X | R \rangle$  of a group, constructs a finite triangulation M(P) of a closed 4-manifold with the following properties:

1. 
$$\pi_1(M(P)) \cong \overline{P}$$
.

2. If P and Q are finite presentations, then M(P \* Q) is homeomorphic to the connect sum M(P)#M(Q).

Combining this with our first group theory lemma regarding splitting  $\Pi_{n,a} * \Pi_{n,b} * \Pi_{n,c}$ , and the fact that we can 'read off' a presentation for the fundamental group of a finite triangulation, we get:

Corollary (C. 2010)

## Corollary (C. 2010)

There is no algorithm that, on input of a finite triangulation of a closed 4-manifold M which splits as a connect sum of two non-simply connected manifolds, outputs two finite triangulations of non-simply connected closed 4-manifolds  $M_1, M_2$  whose connect sum is homeomorphic to M.

## Corollary (C. 2010)

There is no algorithm that, on input of a finite triangulation of a closed 4-manifold M which splits as a connect sum of two non-simply connected manifolds, outputs two finite triangulations of non-simply connected closed 4-manifolds  $M_1, M_2$  whose connect sum is homeomorphic to M.

So just knowing that a 4-manifold splits as a connect sum of non-simply connected pieces is NOT enough to be able to split it as such. (If we could, then the Markov construction would allow us to split  $\Pi_{n,a} * \Pi_{n,b} * \Pi_{n,c}$ ).
